The error could be anywhere within the chunk of code that starts on line 3, but I would check if the file path from your computer (the "/Users/Desktop/..." thing at the beginning of read.table) is correct. Also, I have seen the "cannot open the connection" error before, I think it's possible it might have just timed out?

The file path is working when I run the code, and I've checked the working directory several times, but it still won't make me a pdf... :(same error.

Figured it out - I had to specify the directory in the R script directly, not by going to the dropdown menu lol
